

THE ROLE OF THE ENVIRONMENT IN HUMAN DEVELOPMENT AND PERSONALITY DEVELOPMENT

Tursunova Malika Bakhtiyar qizi

Teacher of the "Primary Education Pedagogy" department

Yashinova Shahzoda Tolkin qizi

Primary education student of group 208

Annotation: *This article fully describes the factors that influence human growth and development: social, natural, family environment.*

Key words: *factors affecting personality development, natural environment, family environment, internal environment, external environment, biological environment, genetic environment.*

If a person's ego is spoiled at a young age and he grows up without education and morals, expecting good from such people is like standing up from the ground and reaching for the stars.

Abdulla Avloniy

One of the factors affecting human maturity is the external environment. Environment means a set of external events that naturally affect a person. This includes natural environment, social environment, family environment (microenvironment).

The natural (geographical) environment (climate, natural conditions) undoubtedly affects the way of life, character and work of a person. For example, the way of life of people living in tropical regions differs from the way of life of people in the far north, which is proven by a number of factors that affect their way of life and their development. Iadi

At the same time, microenvironment - family conditions have a great influence on human development. Because when a child opens his eyes, he sees his parents and relatives. The family environment has a great influence on the child. They say, "A bird does what it sees in its nest." The child grows up in the same environment as the family. The educational environment in which the lifestyle of the family has a positive effect on the upbringing of the child is of great importance in its development.

Family environment is a concept representing the socio-spiritual and moral environment in which family relations and educational processes take place. The role and influence of the family on the formation and growth of the unique spirituality, worldview, imagination and faith of each nation is incomparable. Every family lives on the basis of society's requirements and takes an active part in raising a child according to the needs of the times. The couple remembers the

representatives of the previous generation and continues the traditions left by them, which is reflected in the family environment and the behavior of the child who reaches adulthood.

Social environment is also important in child development. A child who grows up in a good, intelligent family will be orderly, disciplined and responsible. Because industrial relations and social laws regulating them have a special effect on a person. As a result of social communication, i.e. human interaction, a child is prepared for life and work, acquires the necessary experience and knowledge.

A very complex process in human development. It occurs under the influence of external and internal forces. External factors include the natural and social environment that surrounds a person, as well as goal-directed activities for the formation of certain characteristics in children. Internal factors include biological and genetic factors.

Biological (Greek *bois* - life and *logos* - word, education) risks - factors arising from the influence of various living organisms. Biological agents can threaten people, animals, and the environment in general, both at work and at home. Therefore, avoiding their blow is a very important task.

Heredity is the transfer of the organism's own signs and characteristics to future generations, i.e., the properties of organisms to create offspring similar to themselves. Due to heredity, intergenerational material and functional consistency is ensured.

The influence of the social environment on human development is different in different historical periods (formations), it is different, and it affects different social groups in different ways. Therefore, modern pedagogy pays special attention to the environment and its role in human development. It shows that the impact of social life events on the individual, which is included in the concept of environment, is very important, and the social environment is not eternal, but changing. Therefore, the environment is not considered to be the determining factor of human destiny. But its influence cannot be denied.

Not every child is born bad or has bad behavior. It is influenced by the friends of the environment, the relatives of parents and relatives in the family environment, and the hereditary environment. There are cases where an unhealthy environment in the family (no father or mother, divorced, alcohol abuser) will destroy the child's development. To prevent this, the family, parents, neighborhood, teacher should work together, and the child should be constantly monitored should get.
