Abstract: *This article talks about the concept of digital technology, the importance of using digital technologies in the educational system, the reforms implemented by our state in this regard, and the prospects of ensuring cooperation between education and digital technologies. Also, relevant recommendations and conclusions are given on this topic.*

Key words: *science, technology, knowledge, school, upbringing, education, "online" education, technology, digital technologies, "Five Initiatives", "digital economy", Internet, computer, computer literacy.*

It is clear to all of us that the training of qualified specialists who contribute to the development of the country directly depends on the development of the educational system, in this regard, the upbringing of a creative, entrepreneurial, enterprising, in a word, mature person in all respects is considered one of the priorities of state policy today. After all, our President Shavkat Mirziyoyev said in vain: "the main pillar of the New Uzbekistan will be knowledge, education and upbringing!"¹, they did not argue.

As our time progresses rapidly, from year to year, various modern digital technologies are being discovered, as well as our educational institutions make the most of these digital technologies, and the use of various digital technologies in educational classes enriches the quality of education and benefits the widespread use of various techniques. Because, whether we want it or not, today's progress has become largely dependent on the development indicators of their digital technology. That is why the need for young people to have the necessary knowledge and skills in digital technology is considered a requirement of today's time. In particular, it was not for nothing that the third initiative of the five initiatives, promoted by the president of the Republic of Uzbekistan SHavkat Mirziyoyev, to raise the morale of young people, to organize their free time meaningfully and efficiently, was aimed at "organizing the effective use of computer technologies and the internet among the population and young people."

In fact, we are distinguished from animals by our intelligence, thinking, human-specific abilities. For this reason, Angels have a mind-he has no discretion. Animals have

¹ Shavkat Mirziyoyev: "Yangi O'zbekistonning asosiy ustuni — bilim, ta'lim va tarbiya bo'ladi" — Daryo Yangiliklari.

discretion but no intelligence. In humans, there is intelligence and discretion. Therefore, we need to make good use of our mind, at our disposal, to gain knowledge without being distracted by unnecessary work. After all, let's set an example for the next generation. When we start teaching education from a young age, in the future the literacy rate of our young people will increase and contribute to the development of our country. Because, digital technology has become so embedded in our lives that it is becoming more and more active in our lives today. The use of such technologies will enrich the current young generation mentally and spiritually. In the words of our president: "to achieve progress, it is necessary and necessary for us to master digital knowledge and modern information technologies." This gives us the opportunity to follow the shortest path of ascent. After all, digital technologies are deepening into all spheres in the world today.

The use of digital technologies in education is also useful for the fact that it is convenient and high-quality to interest our young people in reading. For example, children who are just going to school may have a slower ability to quickly advance their subjects. Then it can attract, attract attention and remember the reader in an easy way through different slides. This, on the one hand, also relieves the work of teachers. In the Prevention of various documents, such technologies provide much more convenience. One example is in the secondary schools of our country "kundalik.com " we can say that the site began to be maintained. On this site, parents can track the grades their children receive during class. This digital tool allows you to be aware of the most important school news, such as changes in the class schedule or the need to come to various events. Thanks to an electronic diary, children develop more motivation to be more active in class, to show their talents and opportunities without sitting quietly in the back part. The platform also helps teachers to organize their time into a more classroom process, teaching, taking a creative approach to teaching classes.

On March 16, 2019, the state was diagnosed with the initial "corona virus" disease, and since that day, a quarantine situation has been introduced throughout the territory of our republic. This quarantine lasted a long time. Therefore, the work of various organizations, schools, higher education institutions and other enterprises was temporarily transferred to the online form. The transition of educational institutions to online form also provided enormous facilities for students to receive home-sitting education. This is also a vivid example of the cooperation of digital technologies with education. Online classes also have many facilities for students. For example, students can follow classes whenever they want, and re-follow lessons that they do not understand.

It is for this reason that it is of great importance to ensure the rapid digital development of the educational system, as well as all spheres of life of society at present. As proof of this, it is important that the fifth part of the decree of the president of the Republic of Uzbekistan PF — 60 dated January 28, 2022 "on the development strategy of new Uzbekistan for 2022-2026" defines "the establishment of the activities of more than

100,000 free circles provided with the necessary equipment for their knowledge and skills in the field of computer and it technologies”².

Also, in order to further develop the work in this regard, on October 5, 2020, the decree of the president of the Republic of Uzbekistan “on measures to approve the strategy” digital Uzbekistan — 2030” and its effective implementation³ PF-6079 was adopted, the document of this law defines the priority goals, important directions and promising tasks of the development of the digital economy and e-Government of the Republic of Uzbekistan.

In place of the conclusion, I can say that while we live in a digitized world, it is necessary to carry out work taking into account its pros and cons, make the most of digital technologies in educational institutions, increase the level of knowledge of students who are gaining knowledge in the context of the use of digital technologies. Already, digital technologies have the opportunity to ease the lives of people. In a word, the digitization process provides a wide range of opportunities in ensuring the efficiency of our activities, quality of education, transparency and security of the territory, as well as providing comfort to teachers and students.
